Keyboard shortcuts AutoCAD uses its own shortcuts to move the cursor and perform other keyboard functions, and to move objects and tools. These shortcuts differ from the other programs in the AutoCAD software suite and often conflict with those in other programs, such as Word. Before we begin, we recommend that you become familiar with the concept of a hotkey, which is a single key combination that triggers a command or action. You can assign a single hotkey to perform an entire function that would otherwise require multiple keyboard strokes. In AutoCAD, a hotkey is used to activate a shortcut menu or to jump to a tool in the main menu. To create a hotkey, click the Hotkey Manager icon on the AutoCAD ribbon. (The

---

ribbon contains a series of tabs to access common functions, such as menus and tools. The ribbon moves across the screen when you click it, and you can reposition it by clicking the double arrow icons.) When you create a hotkey, a small box appears at the end of the keyboard. You can move this box to any key that you want the hotkey to trigger. Many of the most common AutoCAD keyboard shortcuts are shown here. You can assign more than one hotkey to a single function by assigning a hotkey to each command in the shortcut menu. You can also jump directly to a command or tool in the menu using the shortcut menu. If a command or tool is not assigned a hotkey, you must first click a button in the main menu to jump to it. Click the Hotkey Manager icon on the Ribbon to display the Hotkey Manager. To move the cursor The primary means of moving the cursor in AutoCAD is to type commands in the command window. You can also click a point on the drawing canvas and drag a rectangle or arc to move to that point. The keyboard shortcuts for moving the cursor are shown in the following table. Hotkey Keyboard shortcuts Show Hide Arrow keys Ctrl+Arrow or Shift+Arrow Directional arrow keys Ctrl+→ or Ctrl+← Arrow keys Shift+↑ or Shift+↓ Home arrow key Home or Shift+Home End arrow key End or Shift+End

The present invention relates to a device for cutting obliquely oriented paper and to a device for folding printed products having oblique edges.

Devices are known for cutting obliquely oriented paper which have at least one curved knife which can be moved parallel to the longitudinal axis of the paper. A similar device for cutting obliquely oriented paper is disclosed in U.S. Pat. No. 4,467,500. This document shows a cutting device having a first knife and a second knife which can be moved along with the first knife between two stop positions. However, a

knife of this type cannot always produce a completely straight cut. Moreover, its path of movement is relatively complicated and is constructed with a relatively large number of parts. The complexity of the device is further increased

when it is desired to cut out paper from the obliquely oriented paper stock. This is the case, for example, when strips of paper which are to be attached to the paper to be

printed by adhesives are to be cut out. D. G. Mink,

**Properties of human islet amyloid polypeptide.** The islet amyloid polypeptide (IAPP) is a 37-amino acid peptide isolated from pancreatic islet amyloid deposits. Its sequence has no homology to other known peptides. Recent studies have shown that IAPP is present in

---

pancreatic islets and that it coexists with insulin in the islets. In the present study we demonstrate that IAPP is also present in human plasma and that the hormone is liberated from islet amyloid by a proteolytic process. Furthermore, we show that the hormone is released from the isolated islets in a  $\text{Ca}^{2+}$ -dependent manner. [Neurologic manifestations in amyloidosis]. Among the neurological symptoms observed in amyloidosis, peripheral neuropathy and autonomic nervous system involvement are the most frequent. Three cases of amyloidosis associated with neurologic manifestations, are presented. The clinical, neurophysiological and electroencephalographic (EEG) data in these patients are reviewed. The importance of the detection of
